

# Temperature control

**A modern temperature control chamber is equipped with a digital temperature control, which allows it to adjust the temperature to a precision of between 0.1 and 1 degree centigrade.**

One or more temperature sensors permanently measure the temperature in the working chamber. Continual adjustment, i.e. heating up or cooling down (in the [cooled incubator](#) and [climate chamber](#) – Verlinken auf die entsprechenden Kapitel) ensures that the defined **set temperature** is constantly maintained.
